

Calculation of the BSQV for Pompton Lake, NJ

BSQV = Bioaccumulation-based Sediment Quality Value
 Based on Ecological Receptors
 Using references from Onodaga Lake, NY

$$= \frac{\text{Target Hg Concentration in fish tissue}}{\text{BSAF}}$$

Pompton Lake Data

Surface Area Weighted Sediment Concentrations (mg/kg, dry wt)

Area outside Delta 9.2
 Area outside Delta incl. Channel 6.1

Whole body data
 1998 data 1998 data

BSAFs (kg sediment/kg fish tissue)	Area outside Delta	Area outside Delta incl. Channel
Small fish up to 21 cm	0.087	0.131
Large Fish (>21 cm)	0.219	0.330

Small fish inc. bluegill, largemouth bass, white perch & black crappie
 Lg fish inc. lgm. bass, w. perch, yellow perch, golden shiner & black crappie

BSAFs calculated as mean whole body Hg in fish divided by SWACs for two exposure scenarios

Piscivorous Wildlife = belted kingfisher, great blue heron, osprey, mink and river otter
 diet = 100% fish

Target Tissue Concentrations (mg/kg wet) **	NOAEL	LOAEL	Dietary Contribution %		MeHg	TRV (Avian) **
			Sm Fish	Lg Fish		
Belted Kingfisher	0.011	0.112	100	0	NOAEL=	0.0064
Great Blue Heron	0.035	0.345	33	67	LOAEL=	0.064
Osprey	0.032	0.318	10	90	MeHg	TRC (Mammalian) **
Mink	0.009	0.093	100	0	NOAEL=	0.0025
River Otter	0.014	0.136	40	60	LOAEL=	0.025

** From Onondaga Lake references

	Ave. Sediment Hg Conc based on Area outside Delta	Ave Hg sed conc based on area outside Delta incl. Channel	Ave. Sediment Hg Conc based on area outside Delta
BSQV = Target Sediment Concentrations (mg/kg dry wt)	based on NOAEL	based on LOAEL	based on LOAEL
Belted Kingfisher	0.13	0.86	1.29
Great Blue Heron	0.24	1.57	2.36
Osprey	0.17	1.11	1.67
Mink	0.10	0.71	1.07
River Otter	0.10	0.66	1.00

A BSQV value of 1.0 mg/kg dry wt is recommended to be protective of all piscivorous wildlife receptors that use Pompton Lake

Pompton Lake

Average Sediment Concentrations (ug/g or mg/kg, dry wt)

BSAF (Biota-Sediment Accumulation Factor)

=tot Hg in fish dw/total Hg in sediment, dry wt

Surface:				Species	All Small Fish (whole body)	All Large Fish (whole body)
					1998	1998
Outside Delta	9.2	Value from RIR, 1/08		Area outside Delta (surf)	0.087	0.219
Outside Delta + Channel	6.1	GB estimate for area w/out delta		Area outside Delta + Channel	0.131	0.330
Northern (reference) end of lake	0.301	See Reference sheet

Calculation of the BSQV for Onondaga Lake, NY

Using references from Onodaga Lake, NY

BSQV = Bioaccumulation-based Sediment Quality Value
Based on Ecological Receptors

$$= \frac{\text{Target Hg Concentration in fish tissue}}{\text{BSAF}}$$

Onondaga Lake Data

Small Fish (3-18 cm tot length)	0.27 mg/kg wet wt Hg	(inc banded killifish, brook silverside, sunfish juv, juv w. perch & juv gizzard shad)
Large Fish (18-60 cm tot length)	0.68 mg/kg wet wt Hg	(inc sm bass, lg bass, walleye, w. perch, also bluegill, gizzard shad, carp, br bullhead & ch catfish)
Converted fillet to whole body x 0.7 factor		

Surface area weighted average concentration (SWACs)

Littoral zone = 3.5 mg/kg dry wt

Entire Lake = 2.9 mg/kg dry wt (exposure assumed 67% profundal zone and 33% littoral zone)

BSAFs (kg sediment/kg fish tissue)	Littoral Zone	Entire Lake	Mean
Small fish	0.077	0.093	0.085
Large Fish	0.194	0.235	0.215

BSAFs calculated as mean whole body Hg in fish divided by SWACs for two exposure scenarios

Piscivorous Wildlife = belted kingfisher, great blue heron, osprey, mink and river otter

diet = 100% fish

Target Tissue Concentrations (mg/kg wet)	NOAEL	LOAEL	Dietary Contribution %	
			Sm Fish	Lg Fish
Belted Kingfisher	0.011	0.112	100	0
Great Blue Heron	0.035	0.345	33	67
Osprey	0.032	0.318	10	90
Mink	0.009	0.093	100	0
River Otter	0.014	0.136	40	60

BSQV = Target Sediment Concentrations (mg/kg wet)	based on NOAEL	based on LOAEL
Belted Kingfisher	0.13	1.32
Great Blue Heron	0.2	2
Osprey	0.16	1.57
Mink	0.11	1.09
River Otter	0.08	0.83

Selected a BSQV of 0.8 mg/kg dry wt to be protective of all piscivorous wildlife receptors that use Onondaga Lake
